Live Dashboard

MCP Protocol

The Challenge

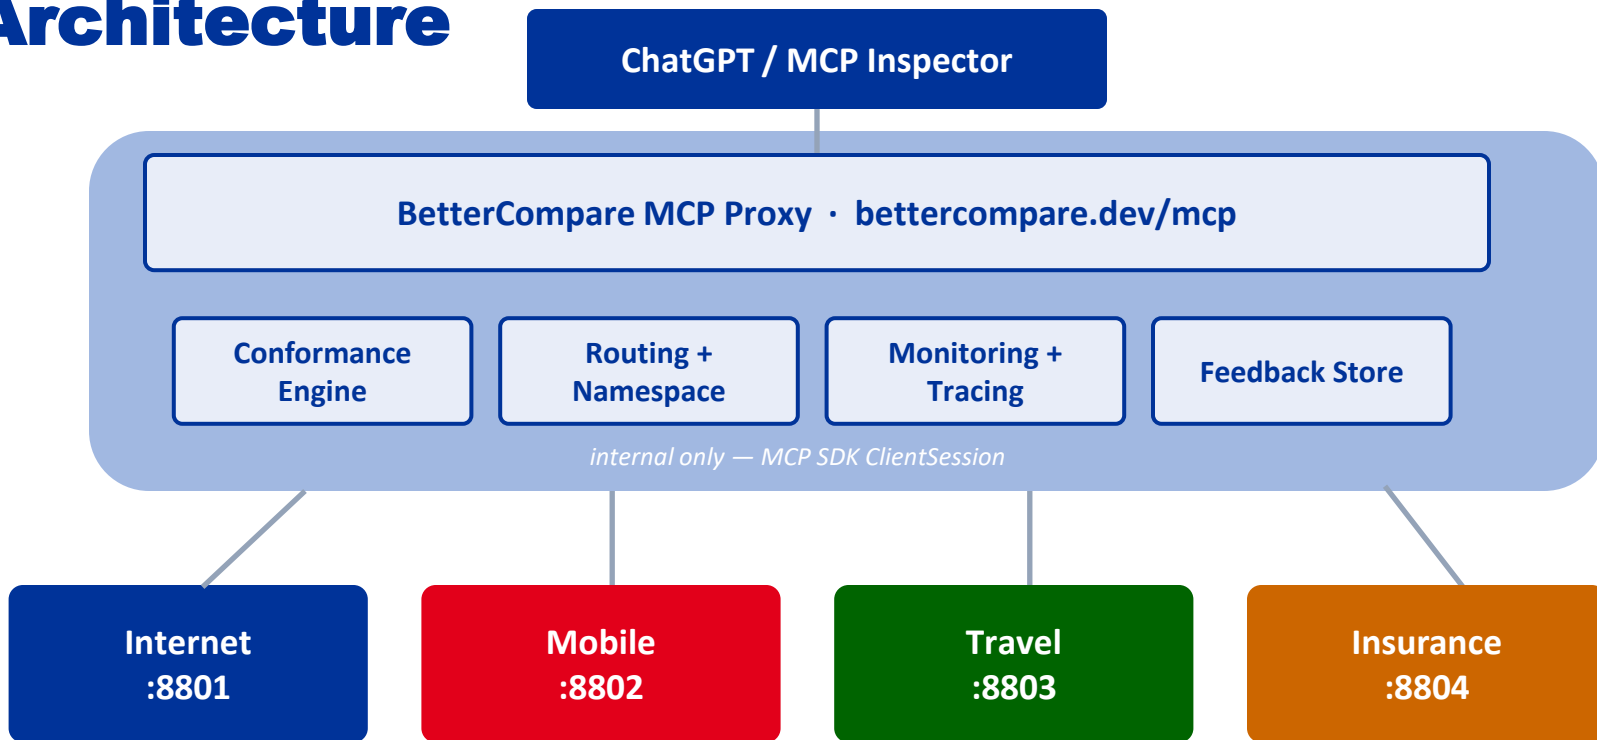

✗ Without a Proxy

- ChatGPT connects to 4 separate MCPs
- No conformance checks
- Silent tool failures
- Naming conflicts between verticals
- No monitoring or tracing
- Breaking changes hit ChatGPT directly

✓ With BetterCompare

- One proxy, one endpoint for ChatGPT
- Every tool validated before exposure
- Actionable feedback with fix suggestions
- Cross-vertical namespacing
- Full tracing, sessions, health dashboard
- Proxy absorbs breaking changes

Architecture

Conformance Engine

6 Rules · 4 Groups

MISSING_NAME [schema]	ERROR
MISSING_SCHEMA [schema]	ERROR
MISSING_DESCRIPTION [schema]	WARNING
ADMIN_TOOL [safety]	ERROR
NAMING_SNAKE_CASE [naming]	WARNING
MISSING_REQUIRED [ux]	WARNING

The Key Feature: fix field

```
{ "rule_id": "MISSING_DESCRIPTION",  
  "severity": "WARNING",  
  "reason": "No meaningful  
description",  
  "fix": "Add a description of  
at least 10 characters"  
}
```

Teams know exactly what to fix — not just that something is wrong.

Policy Modes:

v1 Lenient — tools with warnings still exposed

v2 Strict — any violation blocks the tool

Live Demo

1

Health Check

bettercompare.dev/health

All 4 verticals green

3

Conformance Feedback

bettercompare.dev/feedback

Score 87% · fix field in action

Breaking change detection

Versioning & Per-Vertical QA

Explicit versioning per component

Change Type Who Acts Review?		
Non-breaking	Vertical bumps minor → /reload	No
Breaking change	Proxy detects → teams coordinate	Likely yes
New rule	All verticals re-evaluated	Depends

Per-Vertical QA Mode

```
POST /mcp?vertical=internet
```

```
# or via header:
```

```
POST /mcp  
x-vertical: internet
```

Zero infrastructure changes — same connector URL.
Vertical teams test in isolation without seeing other verticals' tools.

Learnings & Reflections

MCP is more than a protocol

Building with the real SDK showed why Streamable HTTP and tool schemas are so precisely specified. ChatGPT builds trust on top of them.

Conformance is a product problem

Deciding which rules are fair was harder than building the engine. The two-policy approach (v1 lenient, v2 strict) was the answer.

Versioning is underrated

A listed ChatGPT app is approved at a point in time. Explicit versioning is a product requirement, not just a technical nicety.

What I would do differently

Persistent storage first (Redis), circuit breakers for unreachable verticals, conformance as a standalone CLI tool.
